

Executive Summary : Study of Mechanism Model for Social Development Integration

Purpose of Study

To study a model for systematic social development integration and propose an integration mechanism model with information for targeted social development decision to the top management.

A model of mechanism for social development integration

Researchers collect various assumptions concerning social development and human security, which, in the last analysis, are at the heart of development i.e. human development. A model is constructed with relationship among 4 primary levels of development and 5 development dimensions i.e. health, education, economy, environment politics-culture as illustrated.

Model Testing

Researchers test compatibilities of variables collected from various agencies with a developed model using statistical methods (correlation coefficient computed and analysis of covariance then testing with t and F), selecting and testing until variables with high time relationship remain, reliable and capable of reflecting social development integration and then grouping selected variables suitable for application.

Study Result

Researchers collect variables measuring social development from various agencies totally 310. By putting the “people” first, variables passing final selection numbered 45. It could be divided into 3 groups for application of systematic social development administration.

- 1) 17 variables indicating lowest needs, which all human-being should receive.
- 2) 13 variables indicating risks of development which must be carefully monitored and eventually abolished.
- 3) 15 variables indicating national development potential.

Social Development is subject to fast change sensitive, dynamics as well as subject to interpretation. Its administration should be flexible. What social development urgently needs is social information and data.
